FUNCTION: DECOMPOSES HYDROGEN PEROXIDE IN WATER AND OXYGEN; SERVES TO PROTECT CELLS FROM THE TOXIC EFFECTS OF HYDROGEN PEROXIDE.
CATALTITC ACTIVITY: 2 H(2)O(2) = O(2) + 2 H(2)O.
COFACTOR: HEME GROUP.
SUBUNIT: HOMOTETRAMER (BY SIMILARITY).
SUBCELLULAR LOCATION: PETOXISOMAL (POtential).
INDUCTION: BY 3-AMINOTRIAZOLE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.
STRAIN-CV. CORSON 79;

"Structure of tetragonal crystals of human erythrocyte catalase.";
Acta Crystallogr. D 57:1-7(2001).
-!- FUNCTION: OCCURS IN ALMOST ALL ARROBICALLY RESPIRING ORGANISMS AND SERVES TO PROTECT CELLS FROM THE TOXIC EFFECTS OF HYDROGEN
                                                                -: CATALYTIC ACTIVITY: 2 H(2)0(2) = 0(2) + 2 H(2)0.
-:- COFACTOR: HEME GROUP AND NADP.
-:- SUBUNIT: HOMOTETRAMER.
-:- SUBCLILIA: HOMOTETRAMER.
-:- SUBCLILIA: LOCATION: Peroxisomal.
-:- DISEASE: Deficiency in CAT causes acatalasia (or acatalasemia).
This disease is charactelized by absence of catalase activity in red cells and is often associated with ulcerating oral lesions.
-:- SIMILARITY: BELONGS TO THE CATALASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probom; PD000510; Catalase; 1.

The complete catalase (a tetrameric protein) can be used in compsns. for immunising against H.pylori, pref. those implicated in gastritis, peptic ulcers and stomach cancer. The compsns. contain inactive mutant forms of the catalase and may also contain adjuvants e.g. alum, and other H.pylori antigens e.g. urease. The compsns. are pref. encapsulated in liposomes.
                                                                                                                                                                                                                                                                                    Helicobacter pylori; catalase; immunisation; gastritis; peptic ulcer; stomach cancer; mutant; antigen; urease; encapsulate; liposome.

The present sequence represents the N-terminal of the 54 kD protein. The proteins and purified peptides derived from them can be used (by active immunisation) to treat or prevent H. pylori infections (gastritis, peptic ulcers, gastric cancer etc.). Antibodies raised against the protein can be used for psssive immunisation. Derived peptides and antibodies are also useful as reagents for diagnostic immunoassays, and antibodies are further useful for affinity purification of the new proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Helicobacter pylori ATCC 43504 CP2 antigen (AAW06481) is useful in the specific and quantitative detection of H. pylori and in vaccine prodn. CP2 antibody titre shows high correlation with the pathology of gastritis. The CP2 amino acid sequence was deduced from a genomic clone (AAT45042). Slightly different sequences, CP2-PCR1 (AAW06482) and CP2-PCR2 (AAW06483), were deduced from clones (AAT45042-43) obtd. by PCR amplification. Isolation of the gene sequences allows the mass prodn. of recombinant CP2 in transformed host cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Helicobacter pylori CP2 antigen structural polypeptide(s) - also corresponding DNA, useful as reagents for detecting H. pylori and in the production of vaccines

                                    in the specific and quantitative detection of H. pylori and in vaccine prodn. CP2 antibody titre shows high correlation with the pathology of gastritis. The CP2-PCR1 amino acid sequence was deduced from a DNA clone (AAT45642) obtd. by PCR amplification. Slightly different sequences were deduced for CP2 (AAW06481) from genomic DNA (AAT45041) and for CP2-PCR2 (AAW06483) from a PCR fragment (AAT45043) derived from a clinical isolate. Isolation of the gene sequences allows the mass prodn. of recombinant CP2 in transformed

GHPO protein; Helicobacter infection; gastroduodenal disease; gastritis; peptic ulcer disease.
                                                                                                                                                                                                                                                                                                                          Helicobacter pylori CP2 antigen structural polypeptide(s) - also corresponding DNA, useful as reagents for detecting H. pylori and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Helicobacter pylori CP2-PCR2 antigen (AAW06483) is useful in the specific and quantitative detection of H. pylori and in vaccine prodn. CP2 antibody titre shows high correlation with the pathology of gastritis. The CP2-PCR2 amino acid sequence was deduced from a DNA clone (AAT45043) obtd. by PCR amplification of DNA from H. pylori isolated from a patient with chronic gastritis. Slightly different sequences were deduced for CP2 (AAW06481-82) from H. pylori ATCC 43504. Isolation of these gene allows the mass prodn. of recombinant CP2 in transformed host cells.

The Helicobacter pylori catalase is a protein of 58650 Da. The protein, gene sequence and products, such as an immunogenic fragment, can be used for the treatment or prevention of Helicobacter infection, particularly H. pylori infections which cause gastroduodenal disease. They can also be used for the detection and diagnosis of Helicobacter infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated Helicobacter catalase nucleic acid - used to develop products for the treatment or prevention of Helicobacter infection, particularly H. pylori gastroduodenal disease

                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                  ğ
                                                                                                                       This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The Helicobacter pylori catalase is a protein of 58650 Da. The protein, gene sequence and products, such as an immunogenic fragment, can be used for the treatment or prevention of Helicobacter infection, particularly H. pylori infections which cause gastroduodenal disease. They can also be used for the detection and diagnosis of Helicobacter infection.
                                     New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases
                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated Helicobacter catalase nucleic acid - used to develop products for the treatment or prevention of Helicobacter infection, particularly H. pylori gastroduodenal disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-JUL-1
    This sequence represents a clone of the protein of the invention.

The invention relates to a gene that is induced and expressed in a plant under a strong light adapting conditions, and is prepared by a procedure of the following light irradiations (1) to (3) is made on a plant already irradiated by a light irradiations (1) to (3) is made on a consisting of a continuous wave length component of a wave length region of 300-900 nm at 15 to 38 degrees C and the gene expression of which is induced in the cell of said plant: (1) A light of a light component of a wave length region of 300-700 mu E/sq. m s consisting of a continuous wave length component of a wave length region of 350-500 nm at 15-38 degrees C for 1 hour to several days; (2) a light of a light intensity of 200-600 mu E/sq. m s consisting of a continuous wave length component of a wave length region of 350-500 nm at 15-38 degrees C for several hours to several days; (3) a light of intensity 75-270 nm E/sq. m s consisting of a continuous wave length region of 300-800 nm continuous wave length component of a wave length region of 300-800 nm at 0-10 degrees C for several hours to several days. The method can be continuous wave length component of a wave length region of 300-800 nm continuous wave length region plant that is able to grow in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

A composition containing a B. thermoglucosidasius catalase is used to decompose hydrogen peroxide present in residual disinfectant remaining on a contact lens to avoid undesired injury to users. The catalase enzyme can also be used to treat textile substances which have been bleached with hydrogen peroxide. The catalase is derived from a non-mammalian source and reducing the need to use bovine liver catalases so the risk of cross infection from cows to humans is reduced. The production procedure is simple and has low cost with high yield of enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated catalase gene derived from Bacillus thermoglucosdasius useful for decomposing hydrogen peroxide in residual disinfectant remaining on

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for cencide proteins. They are useful for genemic DNA predicted to encode proteins. They are useful for genemic DNA predicted to expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The resent sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                               New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #3121 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                            claim 27; SEQ ID NO 13415; 327pp + sequence listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW40229-W40247 are the N-terminal peptide fragments from various membrane proteins or membrane associated proteins isolated from Helicobacter pylori. Such N-terminal fragments could be used for therapeutic or diagnostic purposes, especially for developing vaccines against H. pylori infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                     The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein #3043 encoded by probe for measuring heart cell gene expression.

                                                                                                                                                                              measuring human gene expression in a sample derived from human heart (see ABA21335-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human brain expressed single exon probe encoded protein SEQ ID NO: 28537.
exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single exon nucleic acid probes for analyzing gene expression in human brains -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                       The present invention relates to single exon nucleic acid probes for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of single exon nucleic acid

                                                                                                                                                                     ö
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow
                                                                                                                                                                     Gaps

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPS are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cervical cancer. Once: The square did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                  Peptide #3065 encoded by probe for measuring cervical gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to novel single exon nucleic acid probes (see AA100010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                       Novel single exon nucleic acid probe used to measuring gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Catalase; PCR; primer; amplification; expression; E.coli; decomposition; hydrogen peroxide; disinfectant; contact lens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe; human; breast disease; breast cancer; development disorder; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                               Peptide #3154 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #3030 encoded by probe for measuring breast gene expression.

polynucleotide which comprises the sequence (1) given in the specification. The invention also describes 1) a catalase polypeptide comprising at least residues 127 to 509 of the fully defined amino acid given in the specification, 2) a recombinant vector carrying comprising the gene; and 3) a transformant transformed by the above recombinant vector. The catalase is useful as an enzymatic agent decomposing hydrogen peroxide contained in waste water.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Vibrio rumoiensis S-1 catalase polypeptide and polynucleotide for treating waste water -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a catalase isolated from Bacillus thermoglucosidasius. A composition containing a B. thermoglucosidasius catalase is used to decompose hydrogen peroxide present in residual disinfectant remaining on a contact lens to avoid undesired injury to users. The catalase enzyme can also be used to treat textile substances which have been bleached with hydrogen peroxide. The catalase is derived from a non-mammalian source and reducing the need to use boyine liver catalases so the risk of cross infection from cows to humans is reduced. The production procedure is simple and has low cost with high yield of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated catalase gene derived from Bacillus thermoglucosdasius useful for decomposing hydrogen peroxide in residual disinfectant remaining on a contact lens -
                                                                                                                                         This sequence corresponds to the catalase protein (kat 19) from the microorganism Bacillus thermoglucosidasius. The gene was PCR amplified and inserted into the plasmid pET-20b for expression in an organism such as E.coli DH5alpha. The protein can be used for the decomposition of hydrogen peroxide contained in the residual disinfectant remaining in a contact lens solution.
                                                                                                                                                                                                                                                                                                                                                                    Gaps

endometrium during the hyperplasia, adenocarcinoma or proliferative phase of the endometrium. The presence and quantities of these proteins can be detected using 2D gel electrophoresis comparison of call lysates. The proteins can be used as biochemical markers to detect the phase of the endometrium and can be measured in body fluids, obviating the need for endometrial biopsies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protection of mammalian cells against immunotoxicity or lipotoxicity - used for treating, e.g. diabetes, obesity, wasting syndromes, osteoporosis, inflammatory diseases, autoimmune diseases or neurodegenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diabetes mellitus; treatment; therapy; nitric oxide; NO; beta cell; fatty acid; lipotoxic; cytotoxic; cytokine; osteoporosis; inflammatory disease; autoimmune disease; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibition of cytokine mediated immunotoxicity of cells can be achieved by blocking free radical production or the accumulation of free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells
                                                                                                                                                          Proteins AAW54349-W54364 are examples of proteins produced in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity. Infinity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                       Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer peripheral nervous system; current nervous system; cNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Υ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ψa
                   death. Cells can also be protected against nitric oxide mediated cytotoxicity by introducing into the cell an antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e.g. IL-1 beta, IL-1 alpha, gamma IFN, TNF alpha, TNF beta, IL-8, IL-7, IL-7, IL-7, IL-7, IL-19, IL-14, IL-17, granulocyte-macrophage colony stimulating factor or monocyte chemoattractant protein-1. The methods can be used for the treatment of e.g. insulin-dependent diabetes mellitus (IDDM), NIDDM, obesity, wasting syndromes, short stature, osteoporosis, inflammatory diseases, autoimmune diseases, or neurodegenerative diseases.

the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotractic/chemokinetic activity, haemostatic and thrombolytic activity, chemotractic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and

The invention relates to human nucleic acids (AAL57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/Anhibin activity, chemctactic/chemckinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.

                                                                                                                                 The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetical and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, itssue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                              Inframmetton.

MAKE: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAK80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a wheat catalase gene which is inserted in a rice genome in order to improve cold-resistance. Such a cold-resistant catalase is useful for the decomposition of hydrogen peroxide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene - useful for producing
the decomposition of hydrogen
Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy -

The present sequence is a rat mitogenic oxidase mox1B
which is capable of stimulating production of superoxide, a reactive
oxygen intermediate (ROI) that affects cell division. The present
sequence was obtained from a rat convalidation. The present
sequence was obtained from a rat convalidation. The present
cells exposed to angiotensin II. Mox1B is a spliced variant of rat mox1,
also referred as p65mox. The mox1B protein functions as a mitogenic
regulator. The present sequence is useful in developing
regulator. The present sequence is useful in developing
regulator. The present sequence is useful in developing
growth, including cancer, psoriasis, prostatic hypertrophy, benign
prostatic hypertrophy, cardiovascular disease, proliferation of vessels,
c s.g. blood vessels and lymphatic vessels, arteriovenous malformation,
vascular problems associated with eye, atherosclerosis, hypertension,
and restenosis following angioplasty.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               also referred as p65mox, which is capable of stimulating production of superoxide, a reactive oxygen intermediate (ROI) that affects cell division. The present sequence was obtained from a rat aortic smooth muscle cell. The moxl protein functions as a mitogenic regulator and shows homology to human moxl protein. It is expressed in aortic smooth muscle cells and induced by angiotensin II, platelet-derived growth factor (PDGF) and phorbol myristic acid (PMA).

The present sequence is useful in developing drugs and therapies for treatment of conditions associated with abnormal growth, including cancer, psoriasis, prostatic hypertrophy, benign prostatic hypertrophy, cardiovascular disease, proliferation of vessels e.g. blood vessels and lymphatic vessels, arteriovenous malformation, was cular problems associated with eye, atherosclerosis, hypertension,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AAY73814-Y74252 represent protein fragments encoded by the human pancreatic tumor cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ü

Patent No. 6022721

APPLICANT: CHANG, Li-Yen Edward

APPLICANT: HWONG, Ching-Long

APPLICANT: HWONG, Ching-Long

TITLE OF INVENTION: No. 6022721e1 Catalase, The Gene Thereof and

TITLE OF INVENTION: Composition Comprising The Same, And Process For Preparing

TITLE OF INVENTION: Catalase Using Genetic Engineering Technology

NUMBER OF SEQUENCES: 10
